English Commentary

VOO is a widely followed exchange-traded fund that tracks the S&P 500 Index. Although VOO's adjusted closing price generally increased from 2023 to November 2026, the chart shows that rising prices did not necessarily indicate improving risk-adjusted performance.

VOO's annualized excess return declined from approximately 20% in 2023 to around 7% in 2026 YTD, while its Sharpe ratio fell from approximately 1.5 to 0.5. This indicates that VOO generated less excess return per unit of volatility during the later part of the period.

Therefore, price movement, absolute return and risk-adjusted return should be considered separately when evaluating investment performance. A rising price indicates positive price performance, but does not necessarily mean that an investment has become more efficient on a risk-adjusted basis.

Key definitions: Excess return is the investment return minus the risk-free rate. The Sharpe ratio measures excess return earned per unit of volatility. A higher Sharpe ratio generally indicates stronger risk-adjusted performance. The 2026 figures are year-to-date results and are not directly comparable with complete calendar years.

中文評論

VOO 係一隻廣受投資者關注、追蹤 S&P 500 指數嘅 ETF。雖然 VOO 嘅經調整收市價由 2023 年至 2026 年 11 月整體呈上升趨勢，但價格上升唔一定代表風險調整後嘅表現持續改善。

VOO 嘅年度化超額回報由 2023 年約 20%，逐步下降至 2026 年至今約 7%；Sharpe ratio 亦由約 1.5 跌至 0.5。呢個結果反映，喺研究期後段，投資者每承受一單位波動風險所獲得嘅超額回報有所減少。

因此，評估投資表現時，應該分開考慮價格走勢、絕對回報同風險調整後回報。價格上升代表投資錄得正面嘅價格表現，但唔一定代表風險調整後嘅投資效率有所提升。

指標解釋：超額回報係投資回報減去無風險利率；Sharpe ratio 則衡量每承受一單位波動風險所獲得嘅超額回報。Sharpe ratio 越高，通常代表風險調整後嘅表現越好。2026 年數據只係年初至今嘅結果，因此唔可以同完整年度作完全直接嘅比較。
